Sequence 16, Application US/09309572

Patent No. 6440730

GENERAL INFORMATION:
APPLICANT: Heinrich-Pette-Institut
ITITLE OF INVENTION: Retroviral hybrid vectors pse
FILE REFERENCE: P50489
CURRENT APPLICATION NUMBER: US/09/309,572
CURRENT FILING DATE: 1999-05-11
EARLIER APPLICATION NUMBER: DE 198 56 463
EARLIER FILING DATE: 1998-11-26
NUMBER OF SEQ ID NOS: 24
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 16
LENGTH: 500
TYPE: PRT
ORGANISM: Human immunodeficiency virus type 1

; Sequence 45, Application US/08816155B
; Patent No. 5990091
; GENERAL INFORMATION:
; APPLICANT: TARTAGLIA, JAMES
; APPLICANT: GETTIG, RUSSELL R.
APPLICANT: MARTINEZ, HECTOR
; APPLICANT: MARTINEZ, HECTOR
; APPLICANT: PAOLETTI, ENZO
APPLICANT: PINCUS, STEVEN E.
; TITLE OF INVENTION: VECTORS HAVING ENHANCED EXPRESSION, AND
; TITLE OF INVENTION: METHODS OF MAKING AND USES THEREOF
; NUMBER OF SEQUENCES: 48
; CORRESSEE: FROMMER LAWRENCE & HAUG ILD
ADDRESSE: FROMMER LAWRENCE & HAUG LLP
STREET: 745 FIFTH AVENUE
CITY: NEW YORK
STATE: NEW YORK
COUNTRY: USA
ZIP: 10151
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/816,155B
FILING DATE: 12-MAR-1997
CLASSIFICATION: 514
ATTORNEY/AGENT INFORMATION:
NAME: KOWALSKI, THOMAS J.
REGISTRATION NUMBER: 32,147
REFERENCE/DOCKET NUMBER: 454310-2990
TELECOMMUNICATION INFORMATION:
TELEPHONE: 212-588-0800
TELEFAX: 212-588-0800
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1405
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1309

Synthetic Env and Gag expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a matrix for the proper presentation of an antigen entrapped or associated to the immune system of the host

The invention also provides proteins encoded by such genes. Sequences of the invention are useful for manufacturing vaccines for treating or preventing human immunodeficiency virus (HIV) infections. They are also useful in gene therapy. The present sequence is HIV-1 subtype C isolate Du422 Gag protein. (Updated on 23-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a vector including a nucleotide sequence encoding an HIV Gag polypeptide, where the nucleotide sequence encoding the Gag polypeptide comprises a sequence having at least 90% sequence identity to 1549 (S1) or 1479 (S2) bp defined in the specification. The vector is useful as a vaccine for the treatment or prophylaxis of HIV infection in a mammal, where the vaccine induces an immunogenic response to the virus-like particles in a suitable susceptible host. This sequence corresponds to an HIV-1 gag protein sequence used in the method of the

                                                                                                                                                                                                   The invention relates to a vector including a nucleotide sequence encoding an HIV Gag polypeptide, where the nucleotide sequence encoding the Gag polypeptide comprises a sequence having at least 90% sequence identity to 1549 (S1) or 1479 (S2) bp defined in the specification. The vector is useful as a vaccine for the treatment or prophylaxis of HIV infection in a mammal, where the vaccine induces an immunogenic response to the virus-like particles in a suitable susceptible host. This sequence corresponds to an HIV-1 gag protein sequence used in the method of the
                                                                                                                                                                                       corresponds invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunogenic fragment of the gene products. The gag gene product is modified to inhibit formation of virus-like particles containing gag gene product and their release from cells, and the pol gene product is modified to inhibit reverse transcriptase activity. The invention also relates to a method for producing an alpha-virus replicon particle used in vaccines. The composition is useful for inducing an immune response to human immunodeficiency virus (HIV) or for treating or preventing HIV infection in a subject. The alpha-virus replicon particle is useful in a vaccine. The composition is useful for administering a protein or peptide to a subject. A composition comprising heparin affinity-purified alpha-virus replicon particle is useful as a clinical trial material and as a commercial product. The present sequence is HIV-1 Clade C gag protein.                                                                                                                                                                                                                                                The present invention relates to a process for the selection of human immunodeficiency virus (HIV) subtype isolates for use in the development of a prophylactic and/or therapeutic pharmaceutical composition. The process involves selecting isolated virus or viruses with a high sequence identity to a consensus sequence and a phenotype which is associated with transmission for the particular HIV subtype. The composition can be used in the production of vaccines against HIV. The present sequence is the HIV-1 subtype C isolate Du422 gag protein. (Updated on 29-AUG-2003 to
                                                                                                                                                                                                                     Sequence 635
                                                                                                                                                                                                                                                                                                                                                             Selecting HIV-1 subtype C isolates, which are useful in developing vaccines against HIV infection, comprises isolating viruses with high sequence identity to a consensus sequence whose phenotype is associate with the HIV subtype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                (MEDI-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                 The invention relates to a novel method of determining whether a compound inhibits formation of a complex between HIV nucleocapsid protein 7 (NCp7) polypeptide and an HIV-psi-site oligonucleotide. The method involves adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Method of determining whether a compound inhibits formation of complex between HIV nucleocapsid protein 7 polypeptide and HIV psi-site oligonucleotide by comparing amount of complex formed in presence/abserof compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 2; SEQ ID NO 109; 105pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2003-646042/61.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human immunodeficiency virus 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           complex; HIV nucleocapsid protein 7; human immunodeficiency virus; HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (ACHI-) ACHILLION PHARM INC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                No.:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method of determining whether a compound inhibits formation of a complex between HIV nucleocapsid protein 7 (NCp7) polypeptide and an HIV-psi-site oligonucleotide. The method involves adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Method of determining whether a compound inhibits formation of complex between HIV nucleocapsid protein 7 polypeptide and HIV psi-site oligonucleotide by comparing amount of complex formed in presence/absence of compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim

The nucleic acid vector is useful immunizing a subject against HIV infection. This sequence corresponds a peptide used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2004-348328/32.

                                                                                                                                                                The invention relates to a novel method of determining whether a compound inhibits formation of a complex between HIV nucleocapsid protein 7 (NCp7) polypeptide and an HIV-psi-site oligonucleotide. The method involves adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.
                                                                                                                                                                                                                                                                                                                                      Method of determining whether a compound inhibits formation of complex between HIV nucleocapsid protein 7 polypeptide and HIV psi-site oligonucleotide by comparing amount of complex formed in presence/absence of compound.

                                                                                                                                              to a partic
                                        The invention relates to a nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles. The nucleic acid vector is useful in immunizing a subject against HIV infection. This sequence corresponds to a peptide used in the invention.
                                                                                                                                                                                                                                     Huang
                                                                                                                                          Nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles, useful in immunizing a subject against HIV infection.
